### **DETAILED ACTION**

### Claim Rejections - 35 USC § 112

1. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

2. Claims 19-20 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. The disclosure and drawing of the present invention fail to specifically disclose the newly claimed step of replacing a preset voice-activated command, stored in the recognition memory that was not recognized for a previous utterance from a user, with a current utterance from the user. The disclosure and drawings of the present invention only discusses steps of modifying vocabulary, adding new vocabulary, deleting vocabulary, and updating user-specific data (paragraphs 30-45). Hence, the newly claimed feature is new matter.

## Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless – (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application

filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

- 4. Claims 1-2 and 6-7 are rejected under 35 U.S.C. 102(e) as being anticipated by Rozak (US 6363347).
- 5. Regarding claim 1, Rozak discloses a method of recognizing speech so as to modify a currently active vocabulary, comprising: receiving an utterance from a user (microphone 8 in figure 4A); comparing said received utterance to a stored recognition vocabulary representing a currently active vocabulary (recognizing utterance in step 3 in figure 5A); and dynamically modifying the stored recognition vocabulary based on said comparison to improve recognition accuracy for a subsequently received utterance (col. 2, lines 19-24), wherein said dynamically modifying includes enabling the user to create a replacement command word that is stored in the stored recognition vocabulary as a replacement command word corresponding to the received utterance, where the user's utterance was not recognized due to the user's accent or other user-specific speech feature (the operation of figure 9 and/or referring to col. 9, lines 26-44).
- 6. Regarding claim 2, Rozak further discloses the method of claim 1, wherein the received utterance is received in a voiced dialog from the user (*referring to figure 4A*), and the step of dynamically modifying the stored recognition vocabulary is based on a current state of user interaction in the voice dialog and on a recognition result (*the operation of figure 9 and/or referring to col. 9, lines 26-44*).

Application/Control Number: 10/027,580 Page 4

Art Unit: 2655

7. Regarding claims 6-7, Rozak further discloses the method of claim 1, said step of receiving including extracting only information in said received utterance necessary for recognition (features extraction is inherently included in a speech recognition system, front-end processing step operated on the input speech extracting essential speech features for use by the speech recognizer), and said step comparing including comparing a speech template representing said received utterance to said stored recognition vocabulary (inherent in a speech recognition system).

### Claim Rejections - 35 USC § 103

- 8. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 9. Claims 8-11, 14, and 19-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hedin et al. (US 6185535) in view of Rozak (US 6363347).
- 10. Regarding claim 8, Hedin et al. disclose a speech recognition system, comprising: a client device receiving an utterance from a user (*microphone 215 in figure 3*); a server in communication with the client device (*referring to figures 1a-b and 3*), the client device comparing said received utterance to a stored recognition vocabulary

Art Unit: 2655

representing a currently active vocabulary (recognizing utterance in element 227 in figure 2); and adding new words to or replacing existing words in speech recognition vocabularies of the client device (col. 11, lines 15-55).

Hedin et al. fail to specifically disclose the step of dynamically modifying the stored recognition vocabulary based on said comparison to improve recognition accuracy for a subsequently received utterance, wherein said dynamically modifying includes enabling the user to create a replacement command word that is stored in the stored recognition vocabulary as a replacement command word corresponding to the received utterance, where the user's utterance was not recognized due to the user's accent or other user-specific speech feature.

However, Rozak teaches the step of dynamically modifying the stored recognition vocabulary based on said comparison to improve recognition accuracy for a subsequently received utterance (col. 2, lines 19-24), wherein said dynamically modifying includes enabling the user to create a replacement command word that is stored in the stored recognition vocabulary as a replacement command word corresponding to the received utterance, where the user's utterance was not recognized due to the user's accent or other user-specific speech feature (the operation of figure 9 and/or referring to col. 9, lines 26-44).

Since Hedin et al. and Rozak are analogous art because they are from the same field of endeavors, it would have been obvious to one of ordinary skill in the art at the time of invention to modify Hedin et al. by incorporating the teaching of Rozak in order to improve speech recognition accuracy for subsequent speech recognition.

Art Unit: 2655

11. Regarding claim 9, Hedin et al. further disclose the step of dynamically modifying of the stored recognition vocabulary is dependent on a current state of user interaction in a voiced dialog of the user that includes the utterance and on a recognition result from the comparison (col. 7, line 41 to col. 8, line 31).

Page 6

- 12. Regarding claims 10-11 and 14, Hedin et al. further disclose that the client device further including an application configured to dynamically modify the stored recognition vocabulary (*col. 11, lines 11-55*), and further including a processor for comparing a speech template representing the received utterance to said stored recognition vocabulary to obtain a recognition result, wherein the processor controls the client application to modify the stored recognition vocabulary (*col. 11, lines 11-55*), and the server further including a vocabulary builder application configured to dynamically modify the stored recognition vocabulary by sending data to client application (*col. 11, lines 11-55*).
- 13. Regarding claim 19, Hedin et al. disclose a method of customizing a recognition vocabulary on a device having a current vocabulary of preset voice-activated commands, comprising: updating speech recognition vocabularies by replacing the vocabulary in the reference database of the client device with a complete set of text, audio data and feature vectors supplied through server (*col. 11*, *lines 41-46*).

Hedin et al. fail to specifically disclose the step of receiving, in response to a given preset voice-activated command previously uttered by a user that was not recognized by the device due to the user's accent or other user-specific speech feature, a current utterance from the user that is designated to replace the un-recognized preset voice-activated command in the stored recognition memory, and dynamically modifying the recognition vocabulary with the received current utterance. As best interpreted, the claim is limited to replacing an existing speech model associated with a corrected word with a current speech utterance that was misrecognized. And, Rozak teaches the step of replacing an existing speech model associated with a corrected word with a current speech utterance that was misrecognized (col. 5, lines 56-67).

Since Hedin et al. and Rozak are analogous art because they are from the same field of endeavors, it would have been obvious to one of ordinary skill in the art at the time of invention to modify Hedin et al. by incorporating the teaching of Rozak in order to improve speech recognition accuracy for subsequent speech recognition.

- 14. Regarding claim 20, Rozak further disclose the method of claim 19, the user implementing a speaker-training feature on the device in order to dynamically modify the recognition vocabulary (*col. 9, lines 26-44*).
- 15. Claim 13 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hedin et al. (US 6185535) in view of Rozak (US 6363347), as applied to claim 8, and further in view of Kenevsky et al. (US 6161090).

Art Unit: 2655

16. Regarding claim 13, the modified Hedin et al. fail to specifically disclose that the server further including a database storing client-specific data that is updatable by the client device. However, Kenevsky et al. further teach that the server further including a database storing client-specific data that is updatable by the client device (col. 7, line 8 to col. 8, line 36, user's model).

Since the modified Hedin et al. and Kenevsky et al. are analogous art because they are from the same field of endeavors, it would have been obvious to one of ordinary skill in the art at the time of invention to further modify Hedin et al. by incorporating the teaching of Kenevsky et al. in order to provide a security level with an arbitrary level of security with speech and speaker recognition technology and natural language understanding. This global architecture has the advantage of being universal and adaptable to substantially any situation.

#### Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Nassiff et al. (US 6418410) and Hon et al. (US 5963903) are considered pertinent to the claimed invention.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Huyen X. Vo whose telephone number is 571-272-7631. The examiner can normally be reached on M-F, 9-5:30.
